Sales Analytics team wants to synced subscription data over to Clari, which could only source data from Opportunity

Each product category had their own formula for calculating quota retirement amount

Opportunity could sell multiple subscriptions of the same product category

Queued ⓘ

2 Triggers - 1 Subflow

QRA calculation could be triggered either by Opp going CW or on demand by for a recalculation. 95% of the logic was the same with both trigger so creating a subflow with different triggers was utilized to reduce flow management.

A schedule path was utilized upon subscription creation to avoid any row lock or automation error rolling back subscription creation.

Trigger Conditions ensured only subscriptions for qualifying product category entered the flow and Update Record filter criteria prevents incorrect QRA from being queued.

Each product category has its own formula and logic.

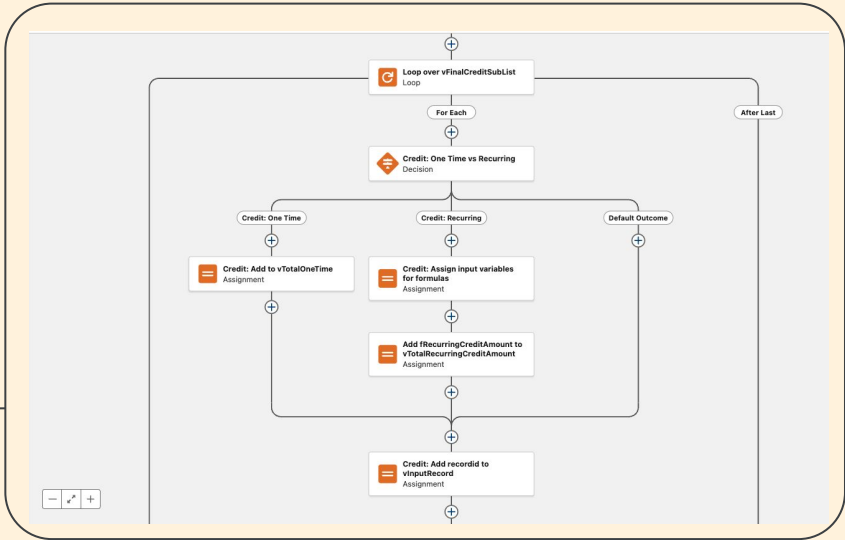

For each product category, qualified subscriptions are inputted into formula calculations to determine the Quota Retirement Amount for said product category.

QRA Calculation Example

Credit subscriptions can be either one time or recurring. Depending on their type, we would calculate their annualized values differently.

Each credit subscription needs to be evaluated individually and then passed through the corresponding formula, then aggregated to list a single total Quota Retirement Amount for Credit subscriptions.

$$((\{!vTotalOneTime\}) + (\{!vTotalRecurringCreditAmount\})) / (\{!vCurrContract.ContractTerm\}) * 12$$

Check Syntax

Consolidating Elements

Common outcomes

While each product category has its own formula, they still share common outcomes such as unqualified

Common variables

Some outcomes have common variables that could be shared between each product category

Common Action

Instead of duplicating and configuring an Update Record element for each product category, routing a connection to a common Update Record avoids additional overhead.

Key concepts demonstrated

1

Automation Trigger control

Localized data and logic on a custom related object to avoid automation traffic on Opportunity.

2

Optimizing for maintainability

Subflows and node connections allows the reuse of common actions and reduces maintenances on duplicative elements on a complex piece of automation.

3

Minimizing and localizing errors

Avoid rollbacks on subscription creation, preventing QRA errors from affecting subscription billing.

4

Executing complexity

Get Record filter criteria, Collection filtering, and Looping over Collections enabled complex product rules and calculations to be performed.
